Determination of acrolein and of formaldehyde in the air.
 I. L. Udina. *Izv. Vuzov 15, No. 3, (1963) 19373, Chem. & Industry 40, 2041. The detn. of acrolein consists essentially in adding H_2O_2 and HCl to its soln. in alc., mixing, adding phloroglucinol soln. and ester. the acrolein content from the pink coloration produced. Under these conditions CH_2O produces a yellow color, so that in presence of the 2 there is obtained a yellowish pink. It is possible to det. the two together by the use of mixed standards. CH_2O should be first identified by means of Hehner's reagent.*

UZEL, R.

SYSTEM MERCURIC CYANIDE-CHROMIETHIOCYANATE AS A TURBID INDICATOR (in acidimetry and alkalimetry). R. Uzel (Coll. Czech. Chem. Comm., 1933, 5, 157-158). -

0.06 g. of $\text{Hg}(\text{CN})_2$ + 0.01 g. of NH_4NO_3 + 0.002 g. of $\text{K}_2\text{Cr}(\text{CNS})_6$ in 1 c.c. added to 25 c.c. of liquid affords at $\text{pH} \approx 4.0$ a turbidity due to $\text{Hg}_2\text{Cr}(\text{CNS})_4$ which redissolves at higher pH . This indicator fails in the presence of I^- , $\text{S}_2\text{O}_3^{2-}$, and large quantities of Br^- and CNS^- , but it is satisfactory in coloured solutions where other indicators are inapplicable and permits the titration of H_2CrO_4 as a strong monobasic acid. Small quantities of free H_2CrO_4 have been determined in commercial $\text{K}_2\text{Cr}_2\text{O}_7$. J.G.A.G.

Argentometric estimation of iodides with cinchonine bismuth nitrate as indicator. R. L. L. (Czechoslovak). Chem. Communication, 5, 383 (1961) (in English). — In an acid soln., Bi^{3+} , cinchonine and I^- give an orange-red ppt. of $\text{C}_{20}\text{H}_{21}\text{NO}_8\text{BiI}_2$. The reaction can be used as a test for I^- or for Bi^{3+} . For the volumetric detn. of I^- , add a little of the reagent (dissolve 2.33 g. of Bi_2O_3 in 10 ml. of hot, concd. HNO_3 , dil. somewhat with water and add 2.34 g. of cinchonine, dil. to 100 ml., add

0.1 g. of urea to remove any HNO_3 present) and titrate with standard AgNO_3 soln. until the red color disappears and the ppt. is all AgI of pale yellow color. The titration takes place best at pH about 4. Before starting the titration, therefore, add 3–5 drops of 2 N HNO_3 to 10–50 ml. of iodide soln. and 0.5–1 ml. of the indicator soln. The results given averaged 0.5%, too low. The titration succeeds fairly well in the presence of considerable Br^- provided some isopropyl alc. is added to suppress the ionization of the halides; about 50% of the alc. should be used. If CN^- is present, it is necessary to use more HNO_3 and titrate more slowly toward the last. If considerable $\text{Fe}(\text{CN})_6^{4-}$ is present, it is well to add some Zn^{++} . Similarly, Zn^{++} should be added if $\text{Co}(\text{CN})_6^{4-}$ is present. With nitroprusside, it is best to work at a greater diln. and match the end point with a suspension of AgI in nitroprusside soln. W. T. H.

AS 55 A METALLURGICAL LITERATURE CLASSIFICATION

even rates, or for the detn. of cyanides, since the turbidity does not result until after the equivalence point has been reached. It can be used for the titration of chromic and phosphoric acids (as strong monobasic acids) and for the detection and detn. of small amts. of free chromic acid in bichromate solns
Edward D. Sanigar

BC

Argentic iodide determination of iodides using cinchonidine and bismuth nitrate as indicator.

B. Urey, (Coll. Czech. Chem. Comm., 1933, 8, 262—1935).—A mixture of cinchonidine nitrate and $\text{Bi}(\text{NO}_3)_3$ may be used as internal indicator in the titration of I^- with AgNO_3 in presence of HNO_3 . The orange-red compound $(\text{C}_{20}\text{H}_{27}\text{O}_8\text{N}_3)_2\text{BiI}_2$ (I) is formed and is decomposed by AgNO_3 . The results are 0.5% low. Most common ions do not interfere. If PO_4^{3-} or AsO_4^{3-} is present, excess of the Bi reagent must be added to ppt. these. The titration may be performed in presence of Cl^- and Br^- . If $[\text{Br}^-] > 4[\text{I}^-]$, an equal vol. of Pr^+OH should be added to suppress the ionization of the bromide and lower the solubility of (I). If $[\text{Cl}^-] > 20[\text{I}^-]$ or $[\text{CN}^-] > [\text{I}^-]$, the I^- must be pptd. as AgI from NH_3 solution, reduced by Zn and acid, and then titrated as described above. In presence of CN^- , the titration must be carried out in strongly acid solution. $\text{Fe}(\text{CN})_6^{4-}$ and $\text{Co}(\text{CN})_6^{4-}$, if present in considerable quantity, should first be pptd. by means of $\text{Zn}(\text{NO}_3)_2$. The method may also be employed for the determination of Ag^+ by titration with KI.

Franning blue as a semiuniversal indicator. R. Umez. *Coll. Czech. Chem. Comm.* 1964; 6: 302-305. — 1965-1966, 7: 395. The indicator is titrated with Cl^- or Br^- in presence of H_2SO_4 and Fe^{3+} alone. The yellow coloration indicates a high concentration, chiefly on the ppt. immediately formed of halide has been added. The results titrated with these obtained potentiometrically. The color obtained by titration alone is unsatisfactory, but Cl^- and Br^- are determined by both titration. Hg^{2+} together with Fe^{3+} are also masked by thioary, and the method is unsatisfactory. *See also* 1965-1966, 7: 395.

<p>Volumetric determination of cobalticyanide ion. B. Uzun and B. Jmink (Coll. Czech. Chem. Comm., 1958, 23, 497-511).—Electrometric titration of $K_3Co(CN)_6$ with $AgNO_3$ always gives results < stoichiometric owing to adsorption of $Co(CN)_6^{3-}$ on colloidal $Ag_2Co(CN)_6$. Analogous results are obtained when Ag is replaced by Hg, Hg^{2+}, and Cu^{2+}. With Cu^{2+}, the end-point becomes more vague as the at. wt. of the added univalent ion increases, but bi- and tri-valent ions do not interfere. K_2CrO_4 indicates the stoichiometric end-point of the titration of $Co(CN)_6^{3-}$ with $AgNO_3$ even in the presence of Zn^{2+} and Mn^{2+} after boiling off excess of HCN in acid solution and neutralizing. Ni, Fe, and other metals are eliminated earlier. $Co(CN)_6^{3-}$ is formed from Co^{2+} by way of the intermediate brownish-red anion $[Co^{III}(CN)_5OH]^{2-}$. J. G. A. Qualitative micro-analysis. F. FEIGL and R. ULLMANN (Microchem., 1936, 10, 132—143).—(a) For the detection of Cu, a drop of the solution under test is treated with 0-1% aq. K₂TeO₆ or KIO₆, and made alkaline with NaOH. K₂S₂O₈ is added, and the solution is heated to 100°. In presence of < 0·02 × 10⁻³ g. of Cu a yellow to red coloration is produced, due to the formation of tervalent Cu compounds. NH₄⁺ or an excess of Cr or Mn should be absent. Conversely, by adding 0·0002 M CuSO₄, 0·5 × 10⁻³ g. of Te (as H₆TeO₆) or 2 × 10⁻³ g. of H₂IO₆ may be detected in presence of other strongly oxidizing anions. Te, in presence of 20,000 parts of Sn, and H₂IO₆ may also be detected by their inhibiting action on the catalytic effect of Cu on the oxidation of Mn⁺⁺ to MnO₄⁻ by NaOBr. (b) NH₄OH is detected by adding FeCl₃, and then making alkaline with NaOH. NH₄OH forms Fe(OH)₃+NH₃, which is detected by its action on AgNO₃+NaNO₂ (A., 1933, 798). (c) Na₂[Fe(CN)₅NO] gives with pyridine in AcOH solution the salt Na₂[Fe(CN)₅C₅H₅N].6H₂O, which given, on filter-paper, a green black with < 0·01 × 10⁻³ g. of Co. Hg, Ca, Ag, Pb, Bi, and Ni which interfere are first removed as insol. salts; Fe is converted into FePO₄.

SENSITIVE (test for) detection of lithium. O. Proctor and R. Usher. (Microchim. Acta, 1936, 3, 105-107).—The reagent used is prepared by dissolving 2 g. of KIO₄ in 10 c.c. of 2N-KOH, diluting to 80 c.c., treating with 2 c.c. of 10% aq. FeCl₃·6H₂O, and diluting again to 100 c.c. This solution is stable. In the test a drop of neutral solution under test is treated with a drop of reagent. In presence of >5 µg. of Li an immediate ppt. is formed. If no ppt. is formed the mixture is heated for 1-2 min. in boiling H₂O, when a yellowish ppt. or cloudiness is obtained in presence of >0.25 µg. The test is unaffected by presence of K, Rb, and Cs, but NH₄ salts should be removed. The test is more sensitive in presence of Na⁺, and by saturating the test solution with NaCl about 0.05 µg. of Li can be detected. J. W. S.

TITLE: Rescue and first aid work in burns

SOURCE: Medicinski glasnik, no. 10, 1964, 315-321

TOPIC TAGS: injury, first aid, health service, public welfare

ABSTRACT: General discussion of the worldwide experiences in mass accidents involving burns, such as the earthquake in Tokyo, the atomic bombs in Japan, etc. and discussion of the increasing number of burns in Yugoslavia due to various factors; currently about 25,000 burned patients are treated annually in the country with many more cases probably going unrecorded. Thermal, chemical, electrical, irradiation, phosphorous and flash burns are discussed separately, together with preventive services and need for immediate care of mass casualties. The principal errors are listed and discussed. Orig. art. has: 1 figure.

AUTHOR: Tulyankin, F. V.; Khol'nov, V. I.; Golovinov, M. F.; Uzenov, Ye. K.; Komkov, P. F.; Zinov'yev, V. K.; Ayupova, Ye. O.; Andreyev, A. D.

TITLE: Effect of technological factors on the structure and properties of forgings from alloy V93

SOURCE: Alyuminiyevy*ye splavy*, no. 3, 1964. Deformiruyemy*ye splavy* (Malleable alloys), 120-135

TOPIC TAGS: aluminum alloy, alloy V93, forgeable alloy, alloy casting process, alloy forging process, ingot mechanical property, forging mechanical property, ingot structure, forging deformation, ingot reheating, iron content, forging temperature, casting temperature

ABSTRACT: The authors report on the technological development of optimal processes for continuous casting of ingots with diameters up to 800 mm from the recently developed alloy V93 (aluminum based, 0.8-1.2% Cu, 1.6-2.2% Mg, < 0.1% Mn, 0.15-0.4% Fe, $\leq 0.02\%$ Si, 6.5-7.5% Zn and $\leq 0.1\%$ Ti) and for the further processing of ingots into forgings weighing up to 2000 kg. The casting process involved secondary refining of melt in the mixer with molten cryolite flux (3 kg/ton) and crushed magnesite filtration between mixer and mold to remove non-metallic impurities. Ingots were homogenized for 50-55 hrs at 470C immediately after casting. The structure of all ingots was fine-grained and homogeneous. Coarse grain areas were found peripherally in larger ingots, but proper selection of mold and cooling

Card 1/2

ACCESSION NR: AT4037653

water pressure limited such graining to machining tolerance areas. Forging involved double or triple redrawing and upsetting. It was found that mechanical properties did not vary significantly across the given range of deformation (ingot diameter = 500 mm to pieces 140, 220 and 325 mm thick); however, the strength of the forged pieces was somewhat lower when forged from ingots with diameter = 800 mm at equal deformation levels. The best hardening temperature was $470 \pm 5^\circ\text{C}$ the optimal forging process involved 12-15 hrs. preheating to a starting forging temperature of 440-380C and a final 320C. "V. P. Manuylov, Yu. M. Saratovtsev, F. P. Verbovoy, Yu. P. Snetkova, A. G. Slobtsov, Z. N. Cherny*kh, N. D. Vinokurov, F. F. Andrianov, Ye. S. Volkov, I. Ya. Zal'tsman, V. G. TITLE: Revealing productivity reserves of the three-cage cold-rolling mill tandem 1000

SOURCE: Moscow. Gosudarstvenny nauchno-issledovatel'skiy i proyektnyy institut obrabotki tsvetnykh metallov. Sbornik nauchnykh trudov. no. 20, 1961. Metallovedeniye i obrabotka tsvetnykh metallov i splavov, 208-217

TEXT: Two three-cage cold-rolling mills, tandem quarto 3750/1000 and 1000 mm, were put into industrial exploitation for the cold-rolling of copper and its alloys, in 1956 and 1958. The institute "Gipro-tsvetmetobrabotka" has for several years cooperated with the plants concerned in the establishing and perfectioning of the working regimes. A series of time-motion studies has been performed, and as the result of the recommendations plant B mill has raised its productivity more than 3-fold between 1956 and 1960, producing at present 3 times as much as the plant A mill. Nevertheless, ample pro-

Card 1/2

Revealing productivity reserves ...

S/680/61/000/020/0'0/0'7
D205/D302

ductivity reserves are still thought to exist. The present paper indicates the measures for revealing these reserves. The measures to be taken can be summarized as follows: Increasing the weight of the feed rolls up to 4 tons will double the productivity of the mill; improving the quality of the feed rolls by reducing the deviations from the standard dimensions; increasing the amount of the cooling emulsion 2 times; changing the winding drum to a stronger than the present one; reconstructing the conical unwinders and the feeding table before the first cage; automating the thickness regulation. All these measures will bring the non ferrous metals cold-rolling mill to the productivity level of the ferrous metallurgy mills. There are 5 tables and 3 Soviet-bloc references.

SOV/66-59-1-7/32

TITLE: Automatic Control of the Production Process of Carbon Dioxide Gas (Avtomaticheskoye regulirovaniye protsessa proizvodstva uglekislogo gaza)

PERIODICAL: Kholodil'naya tekhnika, 1959, Nr 1. pp 32-36 (USSR)

ABSTRACT: The article draws a comparison between hand control and automatic control of the production process of carbon dioxide gas, the parameters of which are illustrated by curves in productional diagrams. While the curves of the former show constant fluctuation, automatic control is reflected by steady, even curves. This shows that with hand control it is impossible to obtain a uniform control of the absorption-desorption process. The article describes the experience made in the Experimental Dry Ice Plant of VNIKhI in the automation of the control of carbon dioxide gas production, by introducing a number of appliances, such as: a pressure regulator for desorption and a pressure regulator for the heating steam. It is recommended to employ electronic apparatus of the type ER-III, designed by VTI and produced by the Moscow Plants "Komega" and "Energopribor". As transducers for the control devices can be used the differential manometer DM-1000 or the

Card 1/2

SOV/66-59-1-7/32

Automatic Control of the Production Process of Carbon Dioxide Gas

manometer ChMP-6. For actuating the control organs, mechanisms of the type PR-1 are used, which consist of 2 asynchronous single-phase 60 w electric motors with rotors mounted on the same shaft. The control device ER-III in conjunction with differential manometer DM-1000 maintains pressure (or difference in pressure) with an accuracy of 0.01 - 0.02 kg/cm². Tests revealed that all apparatus could be relied upon in their performance.

There are 2 graphs, 1 diagram, 2 block diagrams, 1 photo and 4 Soviet references.

TITLE: Partial Automation of Dry Ice Plants (Chastichnaya avtomatizatsiya zavodov sukhogo l'da)

PERIODICAL: Kholodil'naya tekhnika, 1959, Nr 2, pp 53-55 (USSR)

ABSTRACT: Partial automation has been introduced in 2 dry ice plants in the opytnyy kholodil'nik VNIKhI (Experimental Cold Storage Plant VNIKhI) and the Moskovskiy kholodil'nik Nr 10 (Moscow Cold Storage Plant Nr 10), covering automatic regulation of gas; the system has been worked out by VNIKhI. The installation consists of a regulator of desorption pressure, a regulator of heating steam and a regulator of the level of the secondary condensate in the storage tank. The transducer of the pressure regulator of desorber, ChMP-6, is connected with the refrigerator of gas and transforms the changes in pressure into electric signals which are amplified in the electronic control device ER-III and actuate the servo mechanism PR-1. The pressure regulator has the transducer located on the boiler and the control device on the feed pipe. The level regulator of the secondary condensate operates on a two-positional principle; the floating transducer DU-4 has an induction transformer connected with the relaying

TITLE: Multipoint Two-Positional Temperature Regulator MRD-1

PERIODICAL: Kholodil'naya tekhnika, 1959, Nr 3, pp 26 - 29 (USSR)

ABSTRACT:

In 1958 the author worked out a multipoint temperature regulator, the MRD-1, which is being installed in an experimental refrigeration plant of VNIKhI, which comprises 24 cold chambers. The system is composed of resistance thermometers, which transform measurements into electrical signals, which in turn are converted by means of a booster into controlling impulses directed into a servo-mechanism; these pulses can be operating or non-operating ones, depending on the direction in which the temperatures change. The servo-mechanism consists of a relay with self-retaining device, maintaining the position until the next pulse arises. The automatic work keeps the control organs in action; if temperature changes from the set norm, the regulator admits or shuts off cold from the cold chamber. An important feature of this system is that each chamber has its own setter, which enables individual temperature setting for each chamber. There is a generator for the emission of pulses as shown in circuit-diagram 3. Another circuit diagram Nr 4, shows the system which controls the precision of the mechanism; it is equipped with

Card 1/2

Multipoint Two-Positional Temperature Regulator MRD-1

SOV/66-59-3-6/31

visual and audible signals which come into action if there is some interference with proper functioning. In the event of partial breakdown a reserve unit enters automatically into action. The article describes the switch board at the central control point of the installation comprising 2 electronic control devices ER-S-54 acting as two-positional boosters. The installation provides for a system, whereby it is possible by turning a key to change the control from automatic to remote control or to local hand control. Basic technical data of the installation: Minimum return zone of controller 0.2 to 0.3° ; Potential accuracy of regulation 0.3° to 0.5° ; Feeding from net work of alternating current 220 v; Accuracy of work is maintained at fluctuations of feeding voltage within the limits of 185 - 240 v. There are 5 diagrams and 1 photo.

TITLE: Electronic Regulating Device ER-III

PERIODICAL: Kholodil'naya tekhnika, 1959, Nr 5, pp 60-62 (USSR)

ABSTRACT:

In the automatic production of carbon dioxide in the dry ice plants the pressure regulators of desorption and heating steam play an important part. One of the basic elements of these regulators are the electronic devices ER-III, which are used for controlling electric mechanisms of constant speed. These devices can be used in refrigeration installations as regulators of boiling pressure. The device ER-III consists of 2 elements - a measuring and an electronic element. The former can be connected with 3 transducers. The signal of deflection given by the measuring element is amplified in the electronic element and transmitted to the mechanism. Circuit Diagram 1 illustrates the principle of the working system of the automatic device which combines the properties of static and astatic regulators, also called isodromic. Graph 2 illustrates the principle of isodromic regulation by means of device ER-III the technical data of which are given as follows:

Card 1/2

SOV/66-59-5-20/35

Electronic Regulating Device ER-III

minimum zone of insensitivity - not exceeding 6 mv; isodromic period - $T_1 = 0 - 500$ sec; maximum value of the feed-back factor - not less than $1,000/T_1$ mv/sec; power consumed - 20 w; temperature of surrounding atmosphere - not in excess of 40°C ; relative humidity - not exceeding 70%.

The device ER-III is produced in series by the Plants "Komega" and "Energopribor".

There are: 1 circuit diagram, 1 set of graphs and 1 reference.

TITLE: Electronic indicators for refrigerating compressors

PERIODICAL: Kholodil'naya tekhnika, ^{vol. 37} no. 2, 1960, 8 - 12

TEXT: The operation processes of modern piston machines necessitates the use of electronic indicators which permit the devices to be unified and the observation and recording of several processes to be made at the same time. Recently the works of V. Zolotarevskiy [Ref. 1: Analiz rabochego protsessa bystrokhodnykh porshnevnykh dvigateley po indikatornym diagrammam, Laboratoriya dvigateley AN SSSR (Analysis of the operation process of high-speed piston engines by indicator diagrams, Laboratory of Engines of the AS USSR), VINITI, 1957] and V. Kokoshin [Ref. 2: Issledovaniye vliyaniya chisla oborotov na rabochiye koeffitsienty freonogo porshneвого kompressora maloy proizvoditel'nosti. Dissertatsiya, 1955 (Investigation into the effect of the revolution number on the operation coefficients of a piston compressor of low productivity. Dissertation, 1955)] aroused great interest. The first types of electronic indicators were developed in 1954 by V. Kudryavtsev and Yu. Yasenev [Ref. 3: Otchet VNIKhI (Report of the VNIKhI),

1954]. The circuit diagram of an electronic indicator used at the VNIKhI is shown in Figure 1. The resistors of the pickup tensiometers $R_{\partial 1}$ and $R_{\partial 2}$ are connected to two shoulders of the bridge. The resistors R_3 and R_4 form two other shoulders of the bridge. The potentiometer R_5 with the capacitor C compensates the parasitic capacitances of the tensiometers and the conducting wires. An electronic oscillograph 30-7 (EO-7) with a screen diameter of 150 mm, a "Zenit" camera for photographing the oscillograms and a 3F-10 (ZG-10) sound generator for feeding the bridge circuit were used in the experiments. The frequency of the feeding current was 4 kc/s. Figure 2a shows a diagram obtained with an electronic indicator. For magnetoelectric experiments a MPO-2 (MPO-2) oscillograph was used. Figure 2b shows the oscillogram of the process and the designation of the dead points. The transformation of the oscillograms from the coordinates "pressure versus time" into the coordinates "pressure versus piston course" is carried out either graphically or by an approximate formula relating the piston course S with the angle of turning α : $S = R [1 - \cos \alpha + \frac{\lambda}{4} (1 - \cos 2\alpha)]$, where $\lambda = \frac{R}{L}$ is the ratio of the radius of the camshaft to the length of the connecting rod. It was shown that the most important element of the device is the pressure pickup. Figure 3 shows a pickup for big compressors. For small compressors a plate pickup was developed [Ref. 10: L. Medovar, Otchet VNIKhI (Report of the VNIKhI),

1959] which is inserted directly into the valve plate from the cylinder side and communicates with the atmosphere (Fig. 4). The position of the pickup in relation to the cylinder is of utmost importance. In order to obtain accurate results, the device must satisfy the following conditions: 1) the dependence between the pressure to be tested and the deviation of the oscillograph ray must be linear with an accuracy of 1 - 2%; 2) the dependence between the deviation of the ray at a given pressure amplitude and frequency of pressure change must be constant within the frequency range from 0 to f_{max} with an accuracy of 1 - 2%; the maximum frequency depends on the rpm of the machine and can be determined by the formula $f_{max} = \frac{1}{30} \cdot \frac{N}{\pi a_n}$ cycles, where N is the rpm number of the machine and a_n the accuracy of reproducibility; 3) the value of the carrying frequency must surpass the maximum frequency by at least 2 - 3 times; 4) during operation the tensiometers must not be overheated by current; its permissible density must not exceed 50 amp/mm²; the value of the feeding voltage is calculated by the formula $u = 50 S (R_0 + R_6)$, where S is the cross section of the wire in mm², R_0 is the resistance of the pickup in ohm, R_6 is the resistance of the balance shoulder in ohm; in short-time operation the admissible current density can reach 100 amp/mm²; 5) the pickups should have a minimum sensitivity to tempera-

TITLE: Calculation of self-oscillations in "on-off" systems by means of generalized load characteristics

PERIODICAL: Kholodil'naya tekhnika, no. 2, 1963, 14-18

TEXT: The author offers a method for calculating the period of self-oscillations and the duration of its portions by means of generalized load characteristics. It is demonstrated that the object of regulation in a "on-off" system of a refrigerating plant constitutes a link of the first order expressed by $T \frac{dt}{dt} + t = t(\infty)$; T -- time constant of the object of regulation; t -- temperature; $t(\infty)$ -- temperature in stable state. The calculation can be simplified so that the necessary values can be derived from ready graphs. Generalized load characteristics of a system of the first order are shown in Figure 1 of enclosure 1 and the self-oscillations in a system of the first order with delay are the subject of Figure 2 in enclosure 2. The article has 23 formulas and 3 figures.
